1. REMOTE CONTROL

This chapter describes basic configuration of IEEE488.2 based remote control.

1-1.Interface Configuration

1-1-1. Configure Ethernet Connection

The Ethernet interface can be configured for a number of different applications. Ethernet can be configured for basic remote control or monitoring using a web server or it can be configured as a socket server.

The ASR supports both DHCP connections so the instrument can be automatically connected to an existing network or alternatively, network settings can be manually configured.

| | | |
|---------------------|-------------------------------|---------------------------|
| Ethernet Parameters | MAC Address (display only) | DHCP |
| | IP Address | Subnet mask |
| | Gateway | DNS address |
| | DNS Server | Socket port fixed at 2268 |

- | | |
|------------------------|--|
| Ethernet Configuration | <ol style="list-style-type: none">1. Connect a LAN cable from the PC to the Ethernet port on the rear panel. 2. Press the <i>Menu</i> key. The <i>Menu</i> setting will appear on the display. 3. Use the scroll wheel to go to item 3, <i>LAN</i> and press <i>Enter</i>.4. If the LAN cable is installed correctly a connection is active, the <i>Connection Status</i> will show <i>Online</i>. |
|------------------------|--|

- To automatically have the network assign an IP address, set DHCP to ON. Otherwise set DHCP to OFF to manually set the Ethernet settings.

| | |

| DHCP | ON, OFF |

- If DHCP was set to OFF, configure the remaining LAN parameters.

Note

If connecting to an existing network, check the settings with your administrator.

1-1-2. Web Server Remote Control Function Check

Functionality Check

Enter the IP address of the power supply (for example: <http://XXX.XXX.XXX.XXX>) in a web browser after the instrument has been configured for LAN (page 1).

The web interface allows you to:

- View the system and information and the network configuration.
- View the analog control pinout.
- View the dimensions of the unit.
- View the operating area

Example:

The screenshot shows a website for 'TEXIO Test and Measurement Solutions'. At the top right are links for 'Visit Our Site', 'Support', and 'Contact Us'. Below the header, there are three main sections: 'Welcome Page', 'Network Configuration', and 'Analog Control'. The 'Network Configuration' section contains fields for IP Address (172.16.5.125), Subnet Mask (255.255.128.0), Gateway (172.16.0.254), DNS (172.16.1.252), and DHCP State (radio buttons for ON and OFF, with ON selected). Below these are sections for 'Figure of Dimensions' (with a password field) and 'Operating Area' (with a submit button).

1-1-3. Socket Server Function Check

Background

To test the socket server functionality, National Instruments Measurement and Automation Explorer can be used. This program is available on the NI website, www.ni.com, via a search for the VISA Run-time Engine page, or "downloads" at the following URL, <http://www.ni.com/visa/>

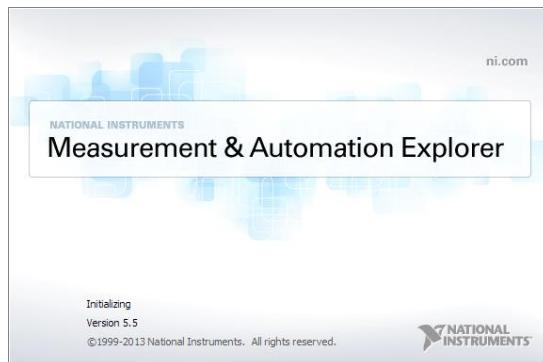

Requirements

Operating System: Windows

Functionality
Check

1. Start the NI Measurement and Automation Explorer (MAX) program. Using Windows, press:

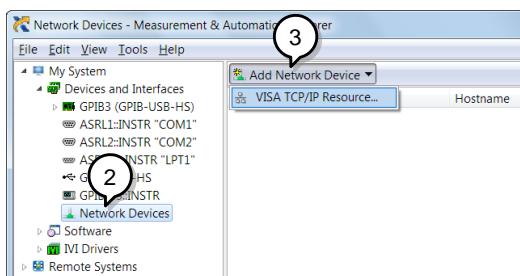

Start>All Programs>NI MAX

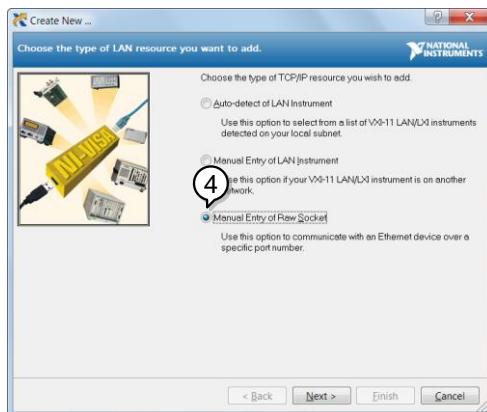

2. From the Configuration panel access;

My System>Devices and Interfaces>Network Devices

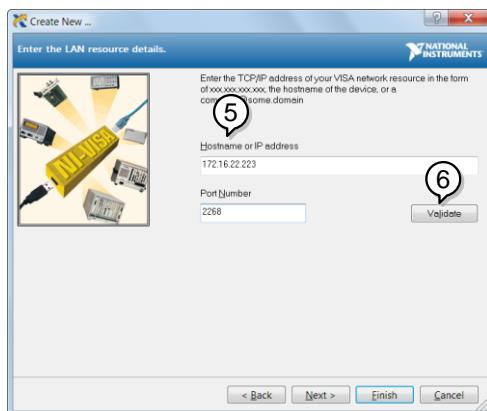

3. Press *Add New Network Device>Visa TCP/IP Resource...*

4. Select *Manual Entry of Raw Socket* from the popup window.

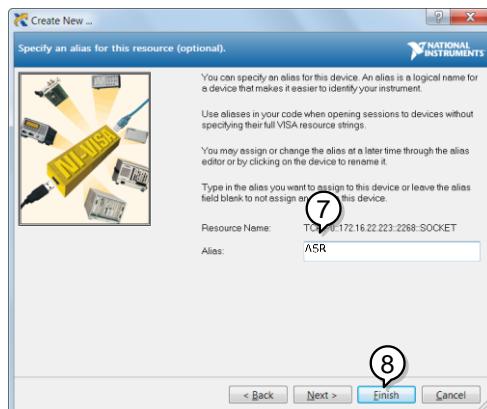

5. Enter the IP address and the port number of the ASR. The port number is fixed at 2268.
6. Double click the Validate button and press *Next*.

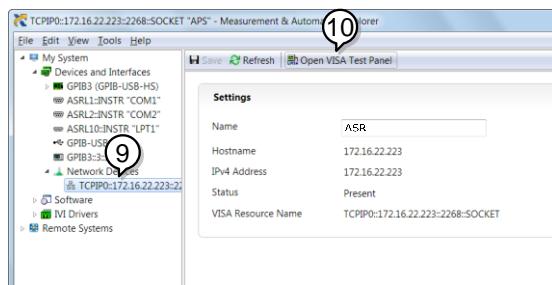

7. Next configure the Alias (name) of the ASR connection. In this example the Alias is: ASR

8. Click finish.

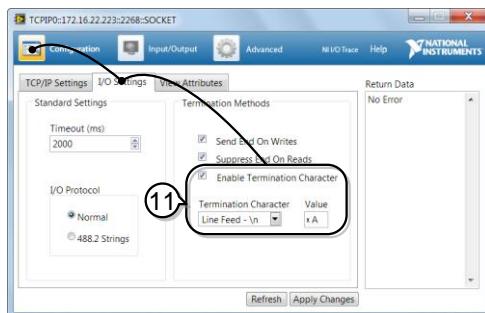

9. The IP address of the power supply will now appear under Network Devices in the configuration panel. Select this icon now.

10. Press Open VISA Test Panel.

11. Click the *Configuration* icon. Under the *I/O Settings* tab check *Enable Termination Character*. The termination character should be set as *Line Feed -\n*.

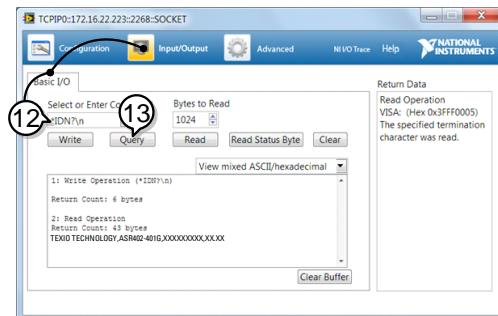

12. Click the *Input/Output* icon. Under the *Basic I/O* tab, make sure **IDN?\n* is entered in the *Select or Enter Command* drop box.

13. Click *Query*.

The ASR will return the machine identification string into the buffer area:

TEXIO TECHNOLOGY, ASRXXX-XXXG,
XXXXXXXXXX, XX.XX

1-2.USB Interface

1-3-3. Using Realterm to Establish a Remote Connection

Background Realterm is a terminal program that can be used to communicate with a device attached to the serial port of a PC or via an emulated serial port via USB.

The following instructions apply to version 2.0.0.70. Even though Realterm is used as an example to establish a remote connection, any terminal program can be used that has similar functionality.

 **Note** Realterm can be downloaded on Sourceforge.net free of charge.
For more information please see <http://realterm.sourceforge.net/>

- Operation**
1. Download Realterm and install according to the instructions on the Realterm website.
 2. Connect the ASR via USB (page 8) or via RS-232 (page 10).
 3. If using RS-232, make note of the configured baud rate, stop bits and parity.
 4. Go to the Windows device manager and find the COM port number for the connection.
For example, go to the Start menu > Control Panel > Device Manager.

Double click the *Ports* icon to reveal the connected serial port devices and the COM

port for the each connected device.

If using USB, the baud rate, stop bit and parity settings can be viewed by right-clicking the connected device and selecting the *Properties* option.

5. Start Realterm on the PC as an administrator.

Click:

Start menu>All
Programs>RealTerm>realterm

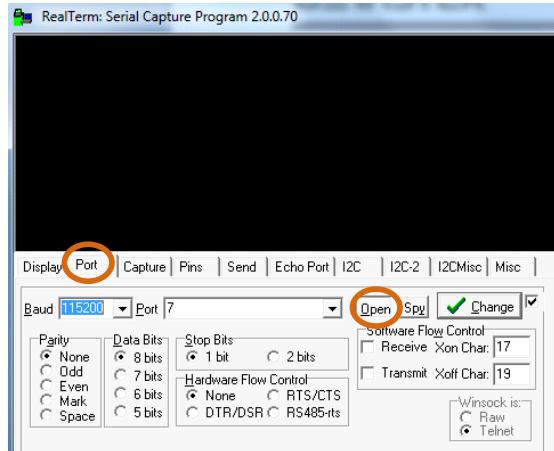

Tip: to run as an administrator, you can right click the Realterm icon in the Windows Start menu and select the *Run as Administrator* option.

6. After Realterm has started, click on the *Port* tab.

Enter the *Baud*, *Parity*, *Data bits*, *Stop bits* and *Port number* configuration for the connection.

The *Hardware Flow Control*, *Software Flow Control* options can be left at the default settings.

Press *Open* to connect to the ASR.

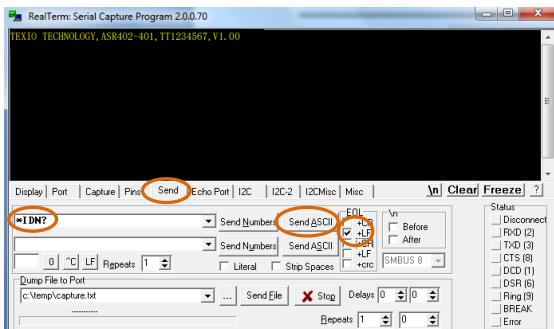

For USB, the baud rate should be fixed to 115,200.

7. Click on the *Send* tab.

In the *EOL* configuration, check on the *+LF* check boxes.

Enter the query:
**idn?*

Click on *Send ASCII*.

8. The terminal display will return the following:

TEXIO TECHNOLOGY, ASRXXX-XXX,
XXXXXXXXXX, XX.XX

(manufacturer, model, serial number, software
version)

9. If Realterm fails to connect to the ASR, please
check all the cables and settings and try
again.

2. Command Syntax

| | | |
|--|---|--|
| Compatible Standard | IEEE488.2 SCPI, 1999 | Partial compatibility Partial compatibility |
| Command Structure | SCPI commands follow a tree-like structure, organized into nodes. Each level of the command tree is a node. Each keyword in a SCPI command represents each node in the command tree. Each keyword (node) of a SCPI command is separated by a colon (:). | |
| For example, the diagram below shows an SCPI sub-structure and a command example. | | |
| <pre>graph TD; MEASURE[MEASure] --> SCALAR[SCALar]; SCALAR --- FREQUENCY[FREQuency]; SCALAR --- CURRENT[CURREnt]; SCALAR --- VOLTAG[E]VOLTage]; CURRENT --- RMS1[RMS]; VOLTAG --- RMS2[RMS];</pre> The diagram illustrates a SCPI command structure. At the top is the command 'MEASure'. A vertical line descends from 'MEASure' to the keyword 'SCALar'. From 'SCALar', three lines branch out to the keywords 'FREQuency', 'CURREnt', and 'VOLTage'. Finally, a line descends from 'CURREnt' to the keyword 'RMS', and a line descends from 'VOLTage' to the keyword 'RMS'. This visualizes how the command 'MEASure:SCALar:FREQuency?' is composed of individual SCPI keywords. | | |
| Command types | There are a number of different instrument commands and queries. A command sends instructions or data to the unit and a query receives data or status information from the unit. Command types | |
| Simple | A single command with/without a parameter | |
| Example | *IDN? | |
| Query | A query is a simple or compound command followed by a question mark (?). A parameter (data) is returned. | |

| | | |
|--|----------|--|
| | Example | meas:curr? |
| | Compound | <p>Two or more commands on the same command line. Compound commands are separated with either a semi-colon (;) or a semi-colon and a colon (;:).</p> <p>A semi-colon is used to join two related commands, with the caveat that the last command must begin at the last node of the first command.</p> |
| | Example | meas:volt?;curr? |
| | | <p>A semi-colon and colon are used to combine two commands from different nodes.</p> |
| | Example | meas:volt?;:sour:volt? |
|  Note (Further explanation) | | <p>A semi-colon(;) is used to connect two commands. A colon(:) at the start of a command indicates that the command starts from the root node. The first command can ignore that first colon. Any commands after the first command (for compound commands) that do not begin with a colon, must begin at the last node of the first command.</p> |

| | |
|-----------------|---|
| Command Forms | Commands and queries have two different forms, long and short. The command syntax is written with the short form of the command in capitals and the remainder (long form) in lower case. |
| | The commands can be written in capitals or lower-case, just so long as the short or long forms are complete. An incomplete command will not be recognized. |
| | Below are examples of correctly written commands. |
| Long form | :SYSTem:ERRor? :SYSTEM:ERROR? :system:error? |
| Short form | SYST:ERR? syst:err? |
| Square Brackets | Commands that contain square brackets indicate that the contents are optional. The function of the command is the same with or without the square bracketed items, as shown below. |
| | For example the query “:OUTPut[:STATe]?” has two valid forms, “:OUTPut:STATe?” and “:OUTPut?”. |
| Command Format |  <ul style="list-style-type: none"> 1. Command header 2. Space 3. Parameter 1 4. Comma (no space before/after comma) 5. Parameter 2 |

| Parameters | Type | Description | Example |
|--|--------------|--|-----------------|
| | <Boolean> | Boolean logic | 0, 1 |
| | <NR1> | integers | 0, 1, 2, 3 |
| | <NR2> | decimal numbers | 0.1, 3.14, 8.5 |
| | <NR3> | floating point | 4.5e-1, 8.25e+1 |
| | <NRf> | any of NR1, 2, 3 1, 1.5, 4.5e-1 | |
| | <block data> | Definitive length arbitrary block data. A single decimal digit followed by data. The decimal digit specifies how many 8-bit data bytes follow. | |
| About the return parameters of ASR series. | <bool> | +0,+1 | |
| | <NR1> | The number with a + sign. | |
| | <NR2> | The number with a + or -sign. The number after the decimal point is fixed at 4 digits. There are exceptions, so check each command. | |
| Message Terminator | LF | Line feed code | |

| Status Byte Register | Any bits set in the Status byte register acts as a summary register for all the three other status registers and indicates if there is a service request, an error in the Error Queue or data in the Output Queue. Reading the Status Byte register will reset the register to 0. | | |
| Service Request Enable Register | The Service Request Enable Register controls which bits in the Status Byte Register are able to generate service requests. | | |

5. Error List

5-1.Command Errors

| | |
|----------|---|
| Overview | <p>An <error/event number> in the range [-199 , - 100] indicates that an IEEE 488.2 syntax error has been detected by the instrument's parser. The occurrence of any error in this class shall cause the command error bit (bit 5) in the event status register (IEEE 488.2, section 11.5.1) to be set. One of the following events has occurred:</p> <ul style="list-style-type: none">• An IEEE 488.2 syntax error has been detected by the parser. That is, a controller-to-device message was received which is in violation of the IEEE 488.2 standard. Possible violations include a data element which violates the device listening formats or whose type is unacceptable to the device.• An unrecognized header was received. Unrecognized headers include incorrect device-specific headers and incorrect or unimplemented IEEE 488.2 common commands. <p>Events that generate command errors shall not generate execution errors, device-specific errors, or query errors; see the other error definitions in this chapter.</p> |
|----------|---|

| Error Code | Description |
|--------------------------------|---|
| -100 Command Error | This is the generic syntax error for devices that cannot detect more specific errors. This code indicates only that a Command Error as defined in IEEE 488.2,11.5.1.1.4 has occurred. |
| -102 Syntax error | An unrecognized command or data type was encountered; for example, a string was received when the device does not accept strings. |
| -103 Invalid separator | The parser was expecting a separator and encountered an illegal character; for example, the semicolon was omitted after a program message unit, MEAS:VOLT:DC?:MEASCURR:DC? |
| -104 Data type error | The parser recognized a data element different than one allowed; for example, numeric or string data was expected but block data was encountered. |
| -108 Parameter not allowed | More parameters were received than expected for the header; for example, the :SYSTem:KLOCK command only accepts one parameter, so receiving SYSTem:KLOCK 1,0 is not allowed. |
| -109 Missing parameter | Fewer parameters were received than required for the header; for example, the :SYSTem:KLOCK command requires one parameter, so receiving :SYSTem:KLOCK is not allowed. |
| -111 Header separator error | A character which is not a legal header separator was encountered while parsing the header; for example, no white space followed the header, thus *SRE2 is an error. |
| -112 Program mnemonic too long | The header contains more than twelve characters (see IEEE 488.2, 7.6.1.4.1). |

| | |
|--------------------------------------|---|
| -113 Undefined header | The header is syntactically correct, but it is undefined for this specific device; for example, *XYZ is not defined for any device. |
| -114 Header suffix out of range | The value of a numeric suffix attached to a program mnemonic, see Syntax and Style section 6.2.5.2, makes the header invalid. |
| -115 Unexpected number of parameters | The number of parameters received does not correspond to the number of parameters expected. This is typically due an inconsistency with the number of instruments in the selected group. |
| -120 Numeric data error | This error, as well as errors -121 through -129, are generated when parsing a data element which appears to be numeric, including the nondecimal numeric types. This particular error message should be used if the device cannot detect a more specific error. |
| -121 Invalid character in number | An invalid character for the data type being parsed was encountered; for example, an alpha in a decimal numeric or a "9" in octal data. |
| -128 Numeric data not allowed | A legal numeric data element was received, but the device does not accept one in this position for the header. |
| -131 Invalid suffix | The suffix does not follow the syntax described in IEEE 488.2, 7.7.3.2, or the suffix is inappropriate for this device. |
| -141 Invalid character data | Either the character data element contains an invalid character or the particular element received is not valid for the header. |
| -148 Character data not allowed | A legal character data element was encountered where prohibited by the device. |
| -151 Invalid string data | A string data element was expected, but was invalid for some reason (see IEEE 488.2, 7.7.5.2); for example, an END message was received before the terminal quote character. |

| | |
|----------------------------------|---|
| -158 String data not allowed | A string data element was encountered but was not allowed by the device at this point in parsing. |
| -160 Block data error | This error, as well as errors -161 through -169, are generated when parsing a block data element. This particular error message should be used if the device cannot detect a more specific error. |
| -161 Invalid block data | A block data element was expected, but was invalid for some reason (see IEEE 488.2, 7.7.6.2); for example, an END message was received before the length was satisfied. |
| -168 Block data not allowed | A legal block data element was encountered but was not allowed by the device at this point in parsing. |
| -178 Expression data not allowed | A legal expression data was encountered but was not allowed by the device at this point in parsing. |

5-2.Execution Errors

| | |
|----------|---|
| Overview | <p>An <error/event number> in the range [-299 , -200] indicates that an error has been detected by the instrument's execution control block. The occurrence of any error in this class shall cause the execution error bit (bit 4) in the event status register (IEEE 488.2, section 11.5.1) to be set. One of the following events has occurred:</p> <ul style="list-style-type: none">• A <PROGRAM DATA> element following a header was evaluated by the device as outside of its legal input range or is otherwise inconsistent with the device's capabilities.• A valid program message could not be properly executed due to some device condition. <p>Execution errors shall be reported by the device after rounding and expression evaluation operations have taken place. Rounding a numeric data element, for example, shall not be reported as an execution error. Events that generate execution errors shall not generate Command Errors, device-specific errors, or Query Errors; see the other error definitions in this section.</p> |
|----------|---|

| Error Code | Description |
|-----------------------------|---|
| -200 Execution error | This is the generic syntax error for devices that cannot detect more specific errors. This code indicates only that an Execution Error as defined in IEEE 488.2, 11.5.1.1.5 has occurred. |
| -201 Invalid while in local | Indicates that a command is not executable while the device is in local due to a hard local control (see IEEE 488.2, 5.6.1.5); for example, a device with a rotary switch receives a message which would change the switches state, but the device is in local so the message cannot be executed. |

| | |
|------------------------------|---|
| -203 Command protected | Indicates that a legal password-protected program command or query could not be executed because the command was disabled. |
| -211 Trigger ignored | Indicates that a GET, *TRG, or triggering signal was received and recognized by the device but was ignored because of device timing considerations; for example, the device was not ready to respond. Note: a DT0 device always ignores GET and treats *TRG as a Command Error. |
| -213 Init ignored | Indicates that a request for a measurement initiation was ignored as another measurement was already in progress. |
| -220 Parameter error | Indicates that a program data element related error occurred. This error message should be used when the device cannot detect the more specific errors described for errors -221 through -229. |
| -221 Settings conflict | Indicates that a legal program data element was parsed but could not be executed due to the current device state (see IEEE 488.2, 6.4.5.3 and 11.5.1.1.5.). |
| -222 Data out of range | Indicates that a legal program data element was parsed but could not be executed because the interpreted value was outside the legal range as defined by the device (see IEEE 488.2, 11.5.1.1.5.). |
| -224 Illegal parameter value | Used where exact value, from a list of possibles, was expected. |

5-3.Device Specific Errors

Overview An <error/event number> in the range [-399 , -300] or [1 , 32767] indicates that the instrument has detected an error which is not a command error, a query error, or an execution error; some device operations did not properly complete, possibly due to an abnormal hardware or firmware condition. These codes are also used for self-test response errors. The occurrence of any error in this class should cause the device-specific error bit (bit 3) in the event status register (IEEE 488.2, section 11.5.1) to be set. The meaning of positive error codes is device-dependent and may be enumerated or bit mapped; the <error message>string for positive error codes is not defined by SCPI and available to the device designer.

Note that the string is not optional; if the designer does not wish to implement a string for a particular error, the null string should be sent (for example, 42,""). The occurrence of any error in this class should cause the device-specific error bit (bit 3) in the event status register (IEEE 488.2, section 11.5.1) to be set. Events that generate device-specific errors shall not generate command errors, execution errors, or query errors; see the other error definitions in this section.

| Error Code | Description |
|--------------------|--|
| -310 System error | Indicates that some error, termed “system error” by the device, has occurred. This code is device-dependent. |
| -320 Storage fault | Indicates that the firmware detected a fault when using data storage. This error is not an indication of physical damage or failure of any mass storage element. |

5-4.Query Errors

| | |
|----------|--|
| Overview | <p>An <error/event number> in the range [-499 , -400] indicates that the output queue control of the instrument has detected a problem with the message exchange protocol described in IEEE 488.2, chapter 6. The occurrence of any error in this class shall cause the query error bit (bit 2) in the event status register (IEEE 488.2, section 11.5.1) to be set. These errors correspond to message exchange protocol errors described in IEEE 488.2, section 6.5.</p> <p>One of the following is true:</p> <ul style="list-style-type: none">• An attempt is being made to read data from the output queue when no output is either present or pending;• Data in the output queue has been lost. <p>Events that generate query errors shall not generate command errors, execution errors, or device-specific errors; see the other error definitions in this section.</p> |
|----------|--|

| Error Code | Description |
|------------------|---|
| -400 Query error | This is the generic query error for devices that cannot detect more specific errors. This code indicates only that a Query Error as defined in IEEE 488.2, 11.5.1.1.7 and 6.3 has occurred. |
